

Week 1 homework

Professor: Behzad Najafi

Student: Hadi salavati

A short summary about the conductive heat transfer and solving the same exercise with $L = 0.4 \text{ m}$, $A = 20 \text{ m}^2$, $\Delta T = 25$, and $k = 0.78 \text{ W/m K}$ using both simple method and using the resistance concept.

Conductive heat transfer: conductive heat transfer is the transfer of heat between two element due to temperature difference. And it depends on some factors like area, thickness, material of objects and temperature difference.

Simple method:

$$\dot{Q} = KA \frac{\Delta T}{L} = 0.78 * 20 * \frac{25}{0.4} = 975 \text{ w}$$

Resistance concept:

$$R_{\text{wall}} = \frac{L}{KA} = \frac{0.4}{0.78 * 20} = 0.0256 \text{ k/w}$$

$$\dot{Q} = \frac{\Delta T}{R} = \frac{25}{0.02564} = 975.039 \text{ w}$$
